## 1 Mailchimp API Authentication and Setup

This section handles the complete authentication and setup process required to interact with the Mailchimp API.

**The process is as follows:**

- 1. Import Libraries:** Load necessary Python libraries (`requests`, `json`, `google.cloud.secretmanager`).
- 2. Set Configuration:** Define constants for the GCP Project ID and the name of the Mailchimp token secret in Secret Manager.
- 3. Retrieve Credentials:** \* Connect to Google Cloud Secret Manager. \* Fetch the stored secret, which contains a JSON object with the `access_token` and `dc` (server prefix).
- 4. Prepare for API Calls:** \* Parse the JSON credentials. \* Dynamically construct the `API_BASE_URL` using the server prefix. \* Create the `headers` dictionary with the Bearer token for authorization.
- 5. Connection Test:** \* Call the `/ping` endpoint to verify that the credentials and connection are valid. A successful test returns a 200 status code.

```
[4]: import sys
import requests
import json
from google.cloud import secretmanager # Direct import is fine for notebooks

print("Libraries imported successfully.")
```

Libraries imported successfully.

```
[5]: # --- Mailchimp Configuration ---

AttributeError: Unknown field for AccessSecretVersionResponse: status_code

```

## 2 Data Extraction from Mailchimp API

Now that authentication is successful, this section focuses on the primary goal: extracting marketing data from Mailchimp endpoints and preparing it for loading into Google BigQuery.

### 2.0.1 Part 1: Fetching List Members

The first step is to download all contacts (list members) from the primary audience.

**The process is as follows:**

1. **Define Extraction Function:** Create a Python function (`fetch_all_mailchimp_members`) that takes the API credentials and a `list_id` as input.
2. **Handle Pagination:** Inside the function, implement a `while` loop to repeatedly call the API, using the `offset` and `count` parameters to navigate through all pages of results until no more members are returned.
3. **Execute Fetch:** Call the function to retrieve the complete list of all members.
4. **Structure for BigQuery:** \* Loop through the raw list of members returned from the API. \* For each member, create a dictionary with two keys: \* `raw_data`: A JSON string of the complete, unaltered member record. \* `[cite_start]tenant_id`: A string identifier for the data source (e.g., 'peer2') to support multi-tenancy[cite: 152, 161, 167, 174].
5. **[cite\_start]Load to BigQuery:** Pass the final list of structured records to a loading function that writes them to the appropriate raw data table (e.g., `peer2_mailchimp_members_raw`)[cite: 128, 154, 168].

```
